SUMMARY

Backend engineer, 4+ years on Go, Java, Python and GCP. Owned production distributed systems from design through on-call. Currently building gRPC microservices and inference routing at Vendasta. Side project: a multi-tenant LLM gateway in Go with cost-aware routing and per-tenant budgets.

SKILLS

Languages: Go, Python, Java, SQL

Distributed systems: gRPC, Protobuf, REST, NATS, RabbitMQ, Google Pub/Sub, microservice design, high availability

Datastores: PostgreSQL, Redis, Spanner, BigQuery, Elasticsearch, MongoDB

Cloud & infra: GCP (GKE, GAE, Spanner, Datastore), AWS, Kubernetes, Docker, Terraform, Jenkins, cloud-native

Observability: OpenTelemetry, Prometheus, Grafana, Jaeger, Datadog, Kibana

AI infrastructure: LLM gateway design, RAG pipelines, Google ADK, Gemini, OpenAI, MCP, Ollama

Testing & quality: TDD, JUnit, Spock, SonarQube, JMeter, integration testing

EXPERIENCE

Vendasta - Software Developer II

Sept 2024 – Present · Chennai, India

- **Owned the REST → gRPC migration** on the inference routing path. Evaluated both protocols against our traffic shape (high call volume, small payloads, lots of fan-out reads), made the call for gRPC, and dropped p99 about 30ms on the hot path.
- Designed and shipped Go services on GKE for the posts and drafts pipeline with deadline propagation and bounded retries. Throughput went up about 40% and we held the 99.9% availability target through a quarter when upstream provider failures roughly doubled.
- Rebuilt CI/CD for the Social Marketing services with Docker multi-stage builds and parallel tests. Deploy time dropped 60% and maintenance windows went away. Moved Prometheus alerts onto SLOs, which mostly killed the pages on-call kept getting for non-issues.
- Drove TDD adoption across 3 production services. Wrote the testing guide adopted across the team. Coverage stayed above 80%, and prod bug volume from those services came down about 35% over the next two quarters.
- Took on **technical-lead responsibilities** for the team: ran design reviews and PR reviews across the services, and mentored 2 engineers through their first on-call rotations and production incidents.

Dataman Computer Systems - Associate Software Developer

Feb 2022 – Sept 2024 · Kanpur, India

- Integrated Cashfree payments. Success rate climbed **from 85% to 98%**. Most of that jump came from a proper idempotency design and treating provider timeouts as a normal case with backoff.
- Benchmarked PostgreSQL + Redis against a NoSQL setup before launch. Our access patterns leaned on joins and transactional writes, so relational won under load. Shipped with 25% faster average response time than the NoSQL option.
- Built async notification workers on RabbitMQ so user-facing requests didn't have to wait on Twilio. Added retry handling and delivery tracking.
- Wrote service design docs on boundaries and caching that other projects ended up reusing. That reuse mattered to me more than any single ship.

PROJECTS

Inference Gateway: multi-tenant LLM gateway in Go. Go · gRPC · PostgreSQL · Redis · NATS · OpenTelemetry · Ollama

- Built **cost-aware routing** that picks the cheapest model meeting each request's latency budget. When a provider fails or breaches SLA, it falls back to local Ollama. Per-tenant budgets and rate limits live in Redis. The gateway returns proper 402 and 429 with Retry-After when tenants overrun.
- Async execution rides on NATS. Implemented worker-based job state tracking, orphan job recovery, and crash reconciliation for the async pipeline.
- SHA-256 API key auth, tenant context carried through gRPC metadata, Redis response caching, 24h idempotency replay keys, jittered retries, Prometheus metrics, and distributed tracing through OpenTelemetry and Jaeger.

EDUCATION

Master of Computer Applications (MCA)

Dr. A.P.J. Abdul Kalam Technical University · June 2020 – July 2022
